

QUIKSLING™

Recovery of persons from moon pools

FALLING INTO A SEAWATER HOLE WHICH IS SURGING AND FALLING FIVE METRES EVERY TWO SECONDS IS THE WORST NIGHTMARE FOR ALL DSV SUBSEA GUYS WHO EARN THEIR CORN AT THE EDGE OF THIS OFFSHORE DEATH TRAP.

EVERYONE IS TICKING LIFE-SAVING APPLIANCE BOXES AND EVERYONE KNOWS THAT BOXES ARE BEING TICKED.

Senior HSE staff are all too aware that there is a problem. They know that, at any time, the mighty sea will smash any notion that having mandatory life-saving equipment installed equals that life saved.

There are no end of problems facing the

rescuer of a person who has fallen into a moonpool. Not least that the normal "pull in to safety" will be the worst possible thing to do if the walls contain water-sucking baffle holes: they will suck the casualty in too and that could be that. Death by drowning after being crushed or caught by the neck under the top edge of a baffle hole as the sea roars upwards.

Unthinkable? If the casualty is not kept in the centre of the pool and hoisted upwards from there, it could happen so easily and so horribly that it just screams for innovation to prevent death here.

One man believes he has a product to solve this recovery problem.

It is called QUIKSLING and the word is that it just may be the new

lifebuoy. It allows the rescuer to capture and recover an immersed person from a distance with little effort.

Using only forces of pull and resistance against a floating human's deadweight, IT WORKS, IT WORKS, IT WORKS!

See what you think.

www.quiksling.com

It is this easy to recover a conscious immersed person from a moon pool with a QUIKSLNG. Rigid frame is easy to submerge under an unconscious person.

The rescuer jerks the line to snap on the chest sling. Casualty plunges frame to allow a "deckchair" hoist

This product and its recovery methods are patented
